

Graduation Rate Analysis – Tableau Dashboard Report

1. Introduction

This Tableau dashboard provides an analysis of student graduation outcomes and examines how factors such as **parental income, parental education, college GPA, and SAT scores** relate to graduation performance. The dashboard presents key performance indicators and interactive visualizations that support data-driven understanding of student success.

The key measures presented include:

- On-time graduation rate
- Average years to graduation
- Average college GPA
- Average parental income
- Years to graduation by parental education
- On-time graduation rate by income bracket
- SAT score versus college GPA

Key Performance Indicators

The dashboard provides four main indicators:

KPI	Result
On-Time Graduation Rate	43.90%
Average Years to Graduate	4.982 years
Average College GPA	3.377
Average Parental Income	\$67,378

2. Key Findings

The dashboard reports an overall **on-time graduation rate of 43.9%**, indicating that fewer than half of the students completed their studies within the expected timeframe. The **average time to graduation is 4.982 years**, while the average college GPA is **3.377**. The average parental income is approximately **\$67,378**.

A major finding is the strong relationship between **parental income and on-time graduation**. Students from households earning **under \$40,000** have the lowest on-time graduation rate, at approximately **4%**. This increases to around **43%** for students from households earning \$40,000–\$70,000 and approximately **50%** for those earning \$70,000–\$100,000. Students from households earning **over \$100,000** have the highest rate, at approximately **63%**. This pattern suggests that financial circumstances may significantly influence students' ability to graduate on time.

The **Years to Graduate by Parental Education** visualization shows relatively small differences across education levels. Average graduation time remains around **4.6 to 5.3 years** across the different parental education categories. This indicates that parental education may have a less pronounced relationship with graduation duration than parental income.

The **SAT Score vs College GPA** visualization shows average SAT scores of approximately **2,000** for students with average GPAs between **3.3 and 3.5**.

3. Recommendations

Based on the dashboard findings, institutions should consider increasing **financial support and assistance programmes**, particularly for students from lower-income households. Scholarships, grants, flexible payment options, and other financial interventions may help reduce barriers that contribute to delayed graduation.

Universities should also strengthen **academic advising and early intervention programmes** to identify students who may be at risk of delayed graduation. Monitoring GPA, academic progress, and other indicators can help institutions provide targeted support before students fall significantly behind.

4. Conclusion

The Tableau dashboard demonstrates that **parental income is an important factor associated with on-time graduation**, while parental education shows a comparatively smaller relationship with the number of years required to graduate. With an overall on-time graduation rate of **43.9%**, there is considerable opportunity for institutions to improve student outcomes.
